単変量循環シフト

(Univariate circular shift)

単変量の有限なサポート領域をもつ配列 $\{u[n]\in\mathbb{K}\}_{n\in\Omega_{\mathrm{u}}\subset\mathbb{Z}}$の循環シフトは， (The circular shift of sequences with univariate finite support region can be represented as)

$\{v[n]\}_n = T(\{u[n]\}_n) = \{u[((n-k))_Q]\}_n,$

のように表現できる． ここで， $Q\in\mathbb{N}$は周期, $\{v[n]\in\mathbb{K}\}_{n\in\Omega\subset\mathbb{Z}}$は出力配列，(where $Q\in\mathbb{N}$ is the period, $\{v[n]\in\mathbb{K}\}_{n\in\Omega\subset\mathbb{Z}}$ is the destination sequence and)

$((n))_Q = n - Q\lfloor Q^{-1}n\rfloor.$

は， Qを法とする n の剰余である．(denotes the n modulo Q.)

【Example】(In case of) $Q=6,\ k=1$ の場合：

$(v[0]\quad v[1]\quad v[2]\quad v[3]\quad v[4]\quad v[5])$
$= T(u[0]\quad u[1]\quad u[2]\quad u[3]\quad u[4]\quad u[5]) = (u[5]\quad u[0]\quad u[1]\quad u[2]\quad u[3]\quad u[4])$
